Surface mineralization

Massive to semi-massive sulphide mineralization occurs at surface at eight geophysical anomalies on the HSP claim. Five of the surface showings are newly discovered. Mineralization occurs as bravoite, chalcopyrite, bornite, and possibly pentlandite in a groundmass of pyrrhotite. Ground geophysical tools were used to assess the conductivity of bedrock around the new and historic showings. The largest new showing is conductive over 150m strike length and average width of roughly 25m. The largest geophysical anomaly on the claim, a 400m X 200m conductor detected from the airborne survey, is untested below thicker cover and remains a priority drill target.

AI Exploration Tools

The exploration program at HSP marks the first field test of Go Metals' proprietary augmented exploration tools. The system generated bedrock maps proved to be more accurate than maps based on ground geophysics or government mapping alone. The AI bedrock map is an important step towards accurately predicting other geological features, such as faults, prospectivity and mineralization. The AI tools are a step for the company towards providing better ESG management through improved low impact exploration techniques;

Ashuanipi Gold Project

Field crews have demobilized from a separate field program in Quebec on the company's new joint venture project. Ashuanipi contains numerous AI targets over banded iron formations. The targets were generated by Windfall Geotek after an expansive 330,000 km AI mining study of eastern Quebec. The project is northeast of Schefferville in the Ashuanipi complex, on the edge of the Superior Province. The initial phase tested targets using till sampling, channel sampling and ground geophysics.
