

Explorex Commences Drill Program at Kagoot Brook Co-Mn Base Metals Project, New Brunswick

Vancouver, B.C. Dec.17, 2018, ExplorexResources Inc. (the “Company” or “Explorex”) (EX:CSE; 1XE:FSE; EXPXF:US) is pleased to announce that crews have been mobilized to initiate the maiden drill program at the cobalt-manganese base metals Kagoot Brook project in New Brunswick.

Kagoot Brook Co-Mn Base Metals Project

Historical work at Kagoot Brook has delineated two drainages, two kilometres apart, that exhibit a series of remarkably anomalous cobalt values up to 6,000 ppm* in the silts (see Company news releases dated May 31 and February 14,2018).

Recent follow-up stream silt sampling programs performed by the Company revealed:

- (i) a significant concentration of and a strong relationship of cobalt with manganese and associated base metals (nickel, copper, lead and zinc);
- (ii) the relative percentage of the cobalt to manganese indicates a favourable high cobalt tenor (i.e. grade component); and
- (iii) a distinct upstream cut-off of the cobalt mineralization (see Company news release dated November 5, 2018).

The project area is blanketed by a thin till cover with little or no outcrop and the in-stream silt grade cut-offs are interpreted to closely reflect the southern contact of the underlying mineralized horizon. The grade cut-offs align well with stratigraphy adding confidence to the >2 km inferred potential length of mineralization along the geological trend.

Kagoot Brook Drill Program

The Company is taking advantage of a window of opportunity presented by a local drill company to complete two holes prior to the Christmas break. This initial two hole, 500 metre drill program is limited in scope and designed to drill one partial transect across the target stratigraphy within the 4 x 1 kilometre target area.

Due to the near-Christmas timing of the drill program, it is anticipated that the core will be processed when the technical crew returns to the Project in the new year, with results reported thereafter.

No drilling has ever been conducted and no source of the historic geochemical anomalies is known on the property.

*Note: The stream silt samples reported in this release are solely designed to show the presence or absence of mineralization and to characterize the mineralization. Silt samples are by definition selective and not intended to provide nor should be construed as a representative indication of grade or mineralization at the projects.
