**Surimeau update – March 29, 2022 update see press release for details**

Assay results from the 1,203m drilled in 7 holes within the 275m strike length of the stripped area at Victoria West, one of several mineralized areas within our >300 km² Surimeau District Property in NW Quebec. SUR-21-28 was drilled for 234m at a dip of -80 as an undercut of SUR-21-26 and SUR-21-27 in the western end of the stripped area, between two historic trenches now within the stripped area. SUR-21-28 assayed 3.46% Ni and 491 ppm Co over 1.5m between 196.5 and 198m down the hole as presented in the table below, within a broad mineralized zone of 170.55m, between 40.9 and 211.45m down the hole which averaged 0.16% Ni and 100.2 ppm Co. Within this broad zone of mineralization there are higher grade sub-zones, as seen in this and other holes drilled in the December program, in this case the zone between 187.5 and 199.5m down the hole, a length of 12m, averaged 0.54% Ni and 138.7 ppm Co, encapsulating the 3.46% Nickel value. Renforth’s current interpretation of the mineralization seen at Victoria West is that there are higher grade bands of mineralization within the extent of the mineralized magnetic ultramafic body. The exceptional 3.49% Ni value points to the high-grade potential
present at Victoria West, which has only seen 5,626m of drilling by Renforth over 2.2km of strike within the known 6km strike length of Victoria West, in the western end of a 20km long magnetic feature also mineralized at its eastern end.

4. Describe and provide details of any products or services that were discontinued. For resource companies, provide details of any drilling, exploration or production programs that have been amended or abandoned.
