PRESS RELEASE 01-08**

Immunall Science Inc. Completes Human Clinical Efficacy Trial for its Immune Boosting Product, ginse™

March 14, 2008

Immunall Science Inc. (“Immunall”) is pleased to announce that it has completed successful human clinical trials demonstrating the effectiveness of Immunall’s lead product, ginse™ as a powerful immune system stimulator on human subjects.

The trials were designed as a placebo-controlled–double blind study with three treatment groups. Some subjects received ginse™; some subjects received capsules of a leading Canadian cold remedy (“Option B”), and some subjects received sugar pills, in order to compare any response solely due to random effects .

Previous in vitro (lab-based, non-human) studies have shown that when lymphocytes grown in culture are exposed to ginse™ they respond with a significantly higher response rate than lymphocytes exposed to Option B.

Current in vivo (human-based) studies have shown that after 3 days of ingestion of either ginse™, Option B or sugar pills, **ginse™ users achieved a significantly higher elevation of lymphocyte production in comparison to Option B or the placebo.**

David Rogers, C.E.O. of Immunall Science Inc. remarked “these results predict that a person who is taking ginse™ will be better able to fend off infectious challenges caused by viruses or bacteria.”

About Immunall Science Inc.

Immunall Science Inc. (ISI) has a patented process for extracting certain components from American ginseng which have been shown to strengthen the immune system in humans and animals. The product ginse (pronounced jin’ say) will be marketed to companies for inclusion in current products as a value added ingredient or as a new stand-alone product.
