

## **PRESS RELEASE**

### **RENFORTH RESOURCES INC.**

65 Front Street East, Suite 304, Toronto, Ontario, M5E 1B5

### **VISUAL RESULTS FOR RENFORTH'S THIRD HOLE**

**Toronto – January 27, 2015 – Renforth Resources Inc. (CSE: RFR)** (“Renforth” or the “Company”) is pleased to announce that fine grained visible gold was intersected in our third drillhole of 2015. Brian H. Newton P Geo will prepare and submit this core for assay; results will be released when available. Renforth has completed the 4 hole program, with visible gold encountered in 3 of the 4 holes drilled, the vein structure associated with the Thompson-Cadillac Mine was encountered in all 4 of the holes drilled.

#### **Visible Gold in REN-15-26 seen in broken face of fracture that is parallel to the core axis**

The third hole in this program – REN-15-26 encountered a 10 centimeter Blue Grey QV at a depth of 27.8 – 27.8 meters down hole. Within the vein is a fracture filled with fine to medium clotty pyrite and numerous fine flecks of visible gold. The vein is hosted by a silicified mafic volcanic unit with patchy sericite alteration and is bedded at 50-55 degrees. Silicification is quite intense immediately surrounding the vein. The degree of silicification increases with depth. An arsenopyrite enriched halo is found

surrounding the vein from 19.2 to 31 meters. Approximately 5cm surrounding the vein on either side is locally intense arsenopyrite mineralization (~5-10%).

The latest drill program targeted gaps in the existing resource model at shallow depths. The veins and alteration packages were consistently intersected as expected at the interpreted location and depths within the stratigraphic package. As these are relatively near surface intersections as in the case of hole REN-15-26 they support the interpretation that the mineralized horizon is continuous to the bedrock / overburden interface.

"We could not be happier with the visual results of our first drilling program of 2015, they imply a positive impact on our resource, due to our visible gold discoveries near surface and outside of the existing resource model" states Nicole Brewster, President and CEO of Renforth.

The technical contents of this press release have been reviewed and approved by Brian H. Newton P. Geo, a qualified person pursuant to the criteria laid out in National Instrument 43-101. Samples have been selected in the field from each of the four holes after logging. These were cut, bagged, tagged and security sealed in rice bags in the field by Brian H. Newton, then securely transported to assay facilities. Upon receipt assay results will be released by the Company.

## **ABOUT RENFORTH**

Renforth Resources Inc. is a Toronto-based gold exploration company with interests in two of Canada's gold exploration camps, the New Alger project, with an inferred resource of 237,000 ounces of gold above a depth of 200 metres contained in 3,505,000 tonnes with a grade of 2.1g/t Au using a cut-off of 0.75 g/t Au (see press release July 17, 2014), located on the Cadillac Break outside of Rouyn, Quebec and the Nixon-Bartleman project, located on the Porcupine-Destor fault in the West Timmins Mining area.
