

PRESS RELEASE

RENFORTH RESOURCES

#304 – 65 FRONT ST. E TORONTO, ON M5E 1B5

Renforth Commences Exploration

Toronto – August 20, 2015 – Renforth Resources Inc. (CSE: RFR) (“Renforth” or the “Company”) is pleased to announce the commencement of summer field exploration on the Company’s Quebec gold properties, Parbec and New Alger, including the recently acquired Bonchamp Claims which are contiguous.

This field program is anticipated to take approximately 3 weeks and is comprised entirely of “boots on the ground” exploration. Renforth is in the unique position of holding ground which has significant portions that are unexplored or prospected, or has not been in quite some time. For each property geophysics, with varying levels of detail, is available, and in some cases historic holes were drilled, however, no detailed or recent geological mapping is available. Renforth feels that “boots on the ground” and mapping is a basic and key exploration technique for these properties, outcrop must be found, mapped and sampled. This technique has proven successful at New Alger with the discovery of the >450m strike length of the gold-bearing Pontiac Vein System at surface south of the Thompson-Cadillac Mine Area. The Pontiac Vein System has not been sufficiently explored to determine its’ entire extent, nor is the gold occurrence included in the existing New Alger Inferred Resource of 237,000 oz of gold (July 17/14 Press release) which is contained above a depth of 200m in the Thompson-Cadillac Mine Area.

The August 2015 exploration targets are as follows;

Parbec – August 2015

- (1) In June of 2015 a 5.61 g/t Au sample was obtained from felsite in the area of the ramp. This is in the sediments and represents one of several parallel mineralized felsite units traced sporadically in historic drilling that have seen insufficient exploration to determine their importance as possible mineralized horizons and will be revisited and prospected for strike continuity. This sample was taken in the field by Brian H. Newton P.Geol, bagged and tagged and then fire assayed for gold. This result has not been previously press released, it is notable in that it is higher than the 5.00 g/t over 0.9m obtained in the nearby historic drill hole PAR-87-21 which intersected the surface occurrence at depth.
- (2) In June of 2015 a diorite body and numerous metre-scale diorite sills were discovered in the southern portion of the property that may host Au mineralization. Au is known to exist in and around similar diorite sills on nearby properties. The diorites on Parbec have not been previously prospected. The extent of this body is unknown, the August program will focus on trying to determine the potential to host significant Au mineralization in this area. Several samples were obtained from various locations within this body, two returned elevated results of 0.34 and 0.37 g/t Au. These samples were also obtained by Brian H. Newton P.Geol, bagged and tagged in the field, subjected to fire assay for gold.

New Alger – August 2015

Renforth plans to prospect several areas of the New Alger property as follows;

- (1) Optioned Claims – in June of 2015 a day spent in the field on the northern portion of the optioned claims resulted in the discovery of quartz veining, visually similar to the vein material found in the “Discovery Vein” of the Pontiac Vein System, however no significant assays were obtained from the grab samples taken. Follow up stripping, and sampling is required in order to obtain a representative amount of material for assay, in order to counter the known coarse gold effect on this property. In addition to this prospecting for extensions to this newly discovered structure will be carried out. If this structure is gold bearing it could represent a greater than 2 km extension to the Pontiac Vein System currently defined in the eastern portion of the property.
- (2) New Alger Mining Concession – the concession has been poorly explored outside of the >450m strike of the Discovery Vein horizon, therefore geologists will move as far west and to the south as the terrain will allow, searching for outcrop and structure, sampling where warranted.

Bonchamp Claims – August 2015

(1) The recently acquired claims cover a large area with no documented ground exploration, prospective geophysical features and regionally mapped structures do exist. Areas of focus in this initial program will include outcrop visible from satellite photos, including outcrops within magnetic trends, as well as isolated magnetic highs. Also of interest is a granitoid body which appears on government maps, in this exploration camp other felsic stocks within the Pontiacs have proven to be gold bearing, therefore this body is a target for exploration. Access to this

claim group is not anticipated to pose any problems, with numerous logging roads and ATV-trails evident in satellite imagery.

Technical information presented in this press release has been reviewed and approved by Brian H. Newton P.Ge, a “qualified person” pursuant to the guidelines laid out in National Instrument 43-101.

ABOUT RENFORTH

Renforth Resources Inc. is a Toronto-based gold exploration company with interests in two of Canada’s gold exploration camps. In the Cadillac-Malartic Gold Camp the Company holds the New Alger project, with an inferred resource of 237,000 ounces of gold above a depth of 200 metres contained in 3,505,000 tonnes with a grade of 2.1g/t Au using a cut-off of 0.75 g/t Au (see press release July 17, 2014) as calculated by Brian H. Newton P.Ge and Philip Burt P.Ge, which is located on the Cadillac Break outside of Cadillac, Quebec and an option to purchase 100% of the Parbec Property, a historically identified gold occurrence with more than 100 drillholes completed and a ramp into the mineralization in place located outside of Malartic, Quebec, contiguous to the Canadian Malartic open pit mine. In Ontario the Company has the right to earn a 55% interest in the Nixon-Bartleman project, located on the Porcupine-Destor fault in the West Timmins Mining area, another historic gold occurrence with a couple of old shallow pits onsite and a history of past drilling which has not yet defined the gold occurrence.

Forward Looking Statements

This news release contains forward-looking statements and information under applicable securities laws. All statements, other than statements of historical fact, are forward looking. Forward-looking statements are frequently identified by such words as ‘may’, ‘will’, ‘plan’, ‘expect’, ‘believe’, ‘anticipate’, ‘estimate’, ‘intend’ and similar words referring to future events and results. Such statements and information are based on the current opinions and expectations of management. All forward-looking information is inherently uncertain and subject to a variety of assumptions, risks and uncertainties, including the speculative nature of mineral exploration and development, fluctuating commodity prices, the risks of obtaining necessary approvals, licenses and permits and the availability of financing, as described in more detail in the Company’s securities filings available at www.sedar.com. Actual events or results may differ materially from those projected in the forward-looking statements and the reader is cautioned against placing undue reliance thereon. Forward-looking information speaks only as of the date on which it is provided and the Company assumes no obligation to revise or update these forward-looking statements except as required by applicable law.
