## NEWS RELEASE

### 2016 STAR PROPERTY EXPLORATION RESULTS

Squire Mining Ltd. (the “Company” or “Squire Mining”) announces the results for its 2016 Work Program. The Star Property is an early stage mining exploration program that is centred on a prominent aeromagnetic low. Geologic mapping has confirmed the presence of highly prospective Eocene Ootsa Lake Group felsic volcanics and that the property is most likely part of the Clisbako volcanic assemblage. This complex hosts the epithermal mineralization at the Baez and Clisbako showings 37 kilometres to the northwest and is probably related to the mineralization at the Bob showing 30 kilometres to the north. The Ootsa Lake Group is related to continental margin magmatic arcs. To date, no mineralization has been found on the property, however outcrop is scarce.

MMITM soil geochemistry has identified some encouraging multi-element silver, cadmium, lead and zinc anomalies on the property especially in the north and western portions of the claims.

The following program is recommended:

- Increased MMI tm soil sampling density around identified anomalies.
- Trenching of anomalies with a small backhoe.

If encouraging results are obtained from the above recommendations, then follow up drilling is warranted.

A report on the 2016 work program has been submitted to the B.C. Minerals titles branch to cover assessment on the property. MMI tm results and maps of the 2015 program can be found on the Squire Mining website ([www.squiremining.com](http://www.squiremining.com))

Mr. Andrew L. Wilkins, P.Geol., Manager of Exploration, is the qualified person responsible for the technical content of this news release.

ON BEHALF OF THE BOARD
